Lessons

Summary

Goal

Redesign the sports eCommerce site and increase our retention.

Outcome

- Increased Customer Return Rate by 15%.
- Improved SEO and Usability.
- We also won more awards that year for Sports Site of the year.
- Customers loved the changes, commenting on social media about the changes positively.

Goal Definition

Problems & Opportunities

Stagnating growth

Issues with site usability, impacting user experience but also SEO.

Problems implementing new features

New rebrand

Goals

- Improve growing usability issues.

- Standardise the experience so we can implement new features more effectively

- Implement the new rebrand across the e-commerce experience.

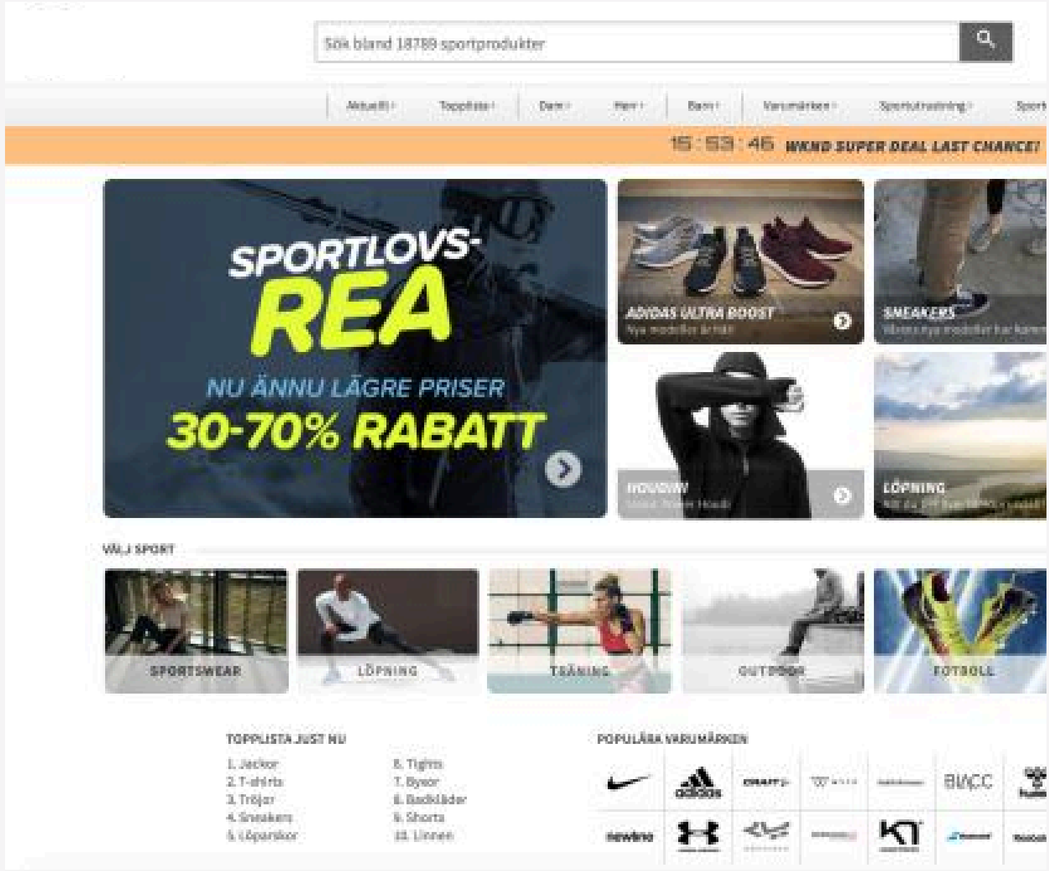

Insights

- Service and selection was great, but site on mobile and desktop were hard to use.

- It was difficult to find products due to the sheer quantity of selection and information.

- A lot of features and options, such as browsing through brands, were not findable or very usable.

- An inconsistent experience meant customers returned *in spite* of the experience due to the quality of selection and service.

Excuse the blurry image, it's all I could gather from the old site,

Process

Brand Visual Redesign

Design Process

Design System

Brand Visual Redesign

The Brand redesign was done in tandem with the Site Redesigns.

A close collaboration with branding meant we were able to embed the brand identity into the UI visual direction.

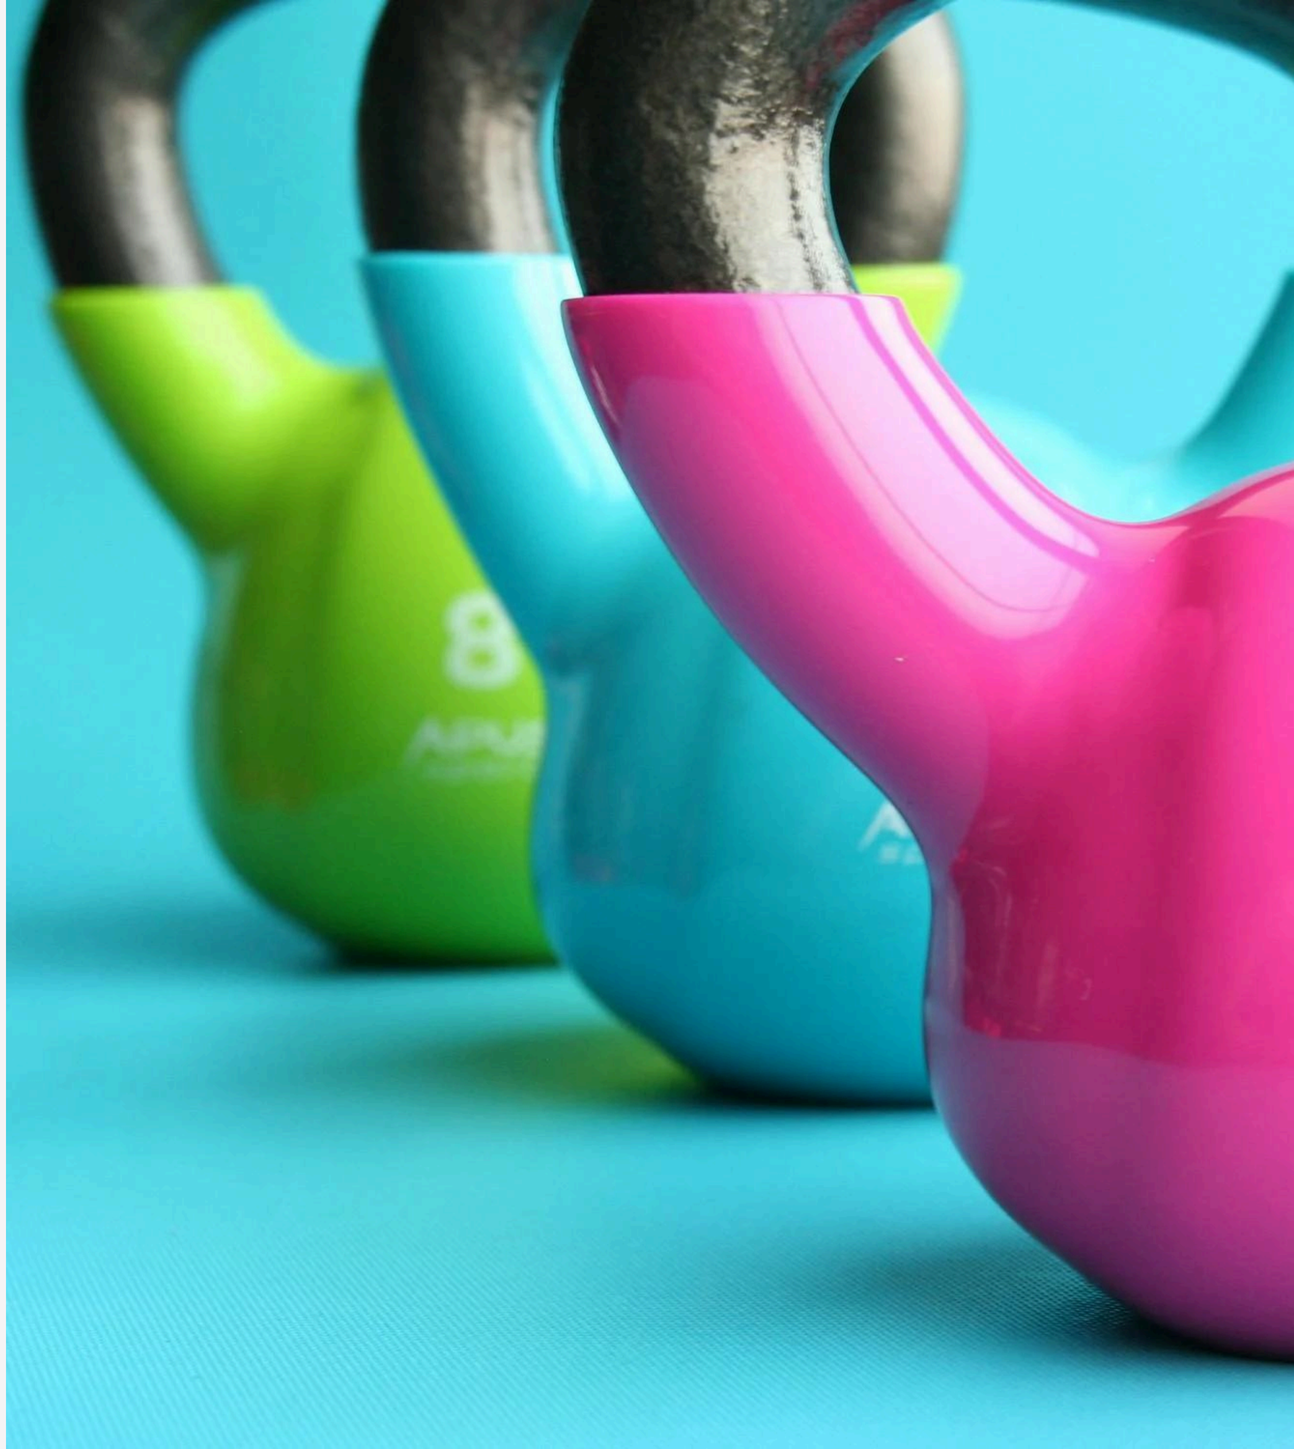

This was centred around slanted inclines, and rounded corners combined with occasional sharp corners.

Design Process & Design System

We implemented a Design System, including Tokens that handled the Fonts, Colours and Spacing.

We then introduced a Discovery cycle that included **Ideation > Prototype > Usability Study > Implement > Measure.**

We managed to unify the experience, validate our decisions and embed the Brand direction all in one big leap.

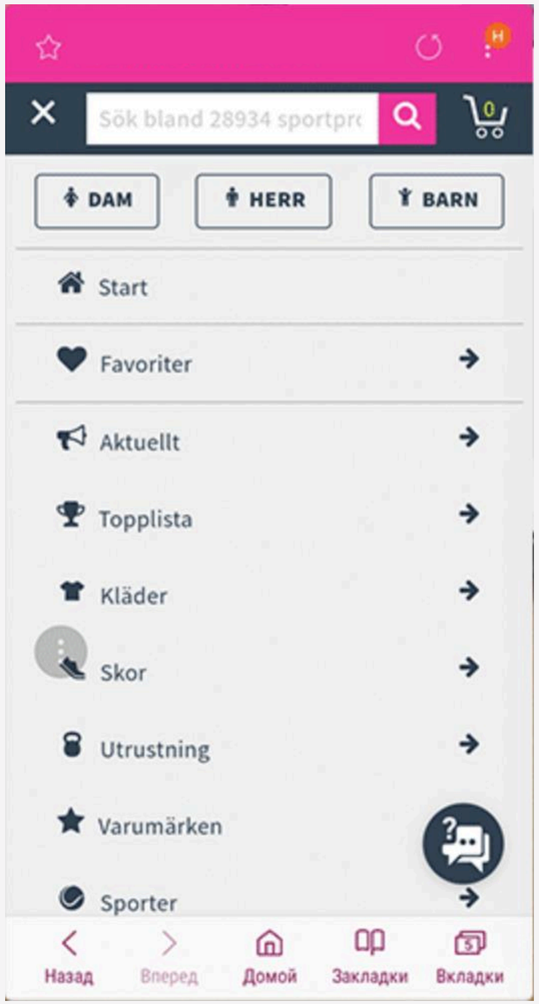

Site Redesign

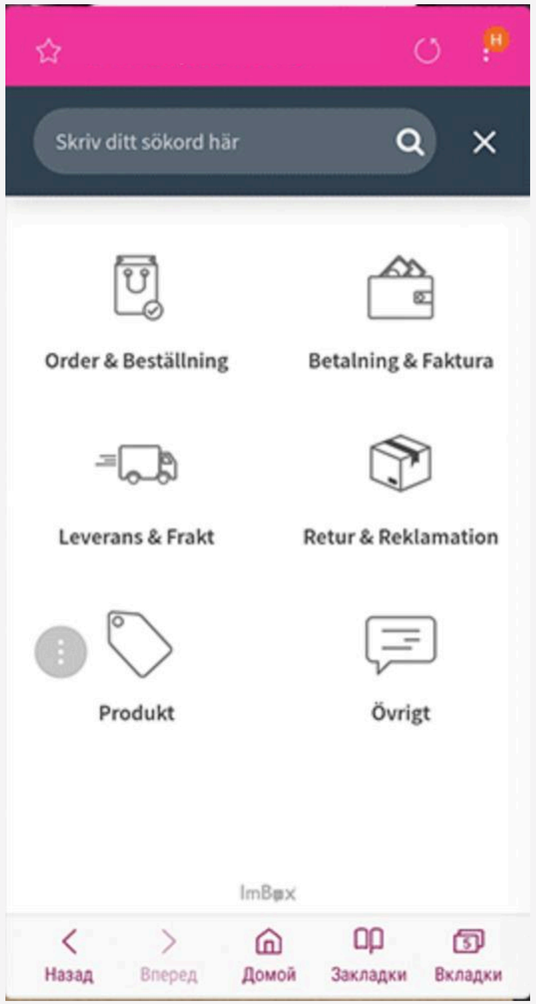

Mobile Web

Desktop

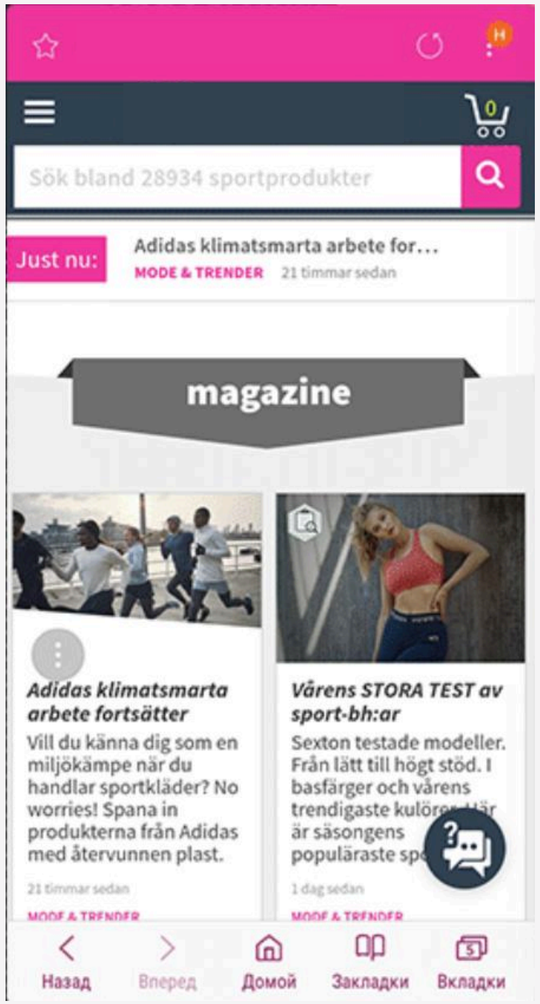

Mobile Web - How it started

Before we started, the colours were very heavy, elements were very close together, and the elements were very sharp.

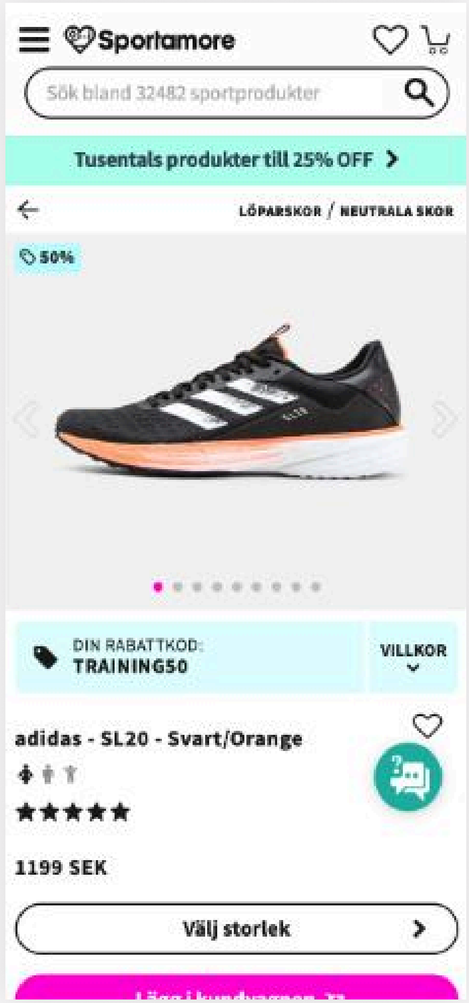

Elements were also inconsistent in spacing, like in this case where we used a 3rd party which clashed with the rest of the experience.

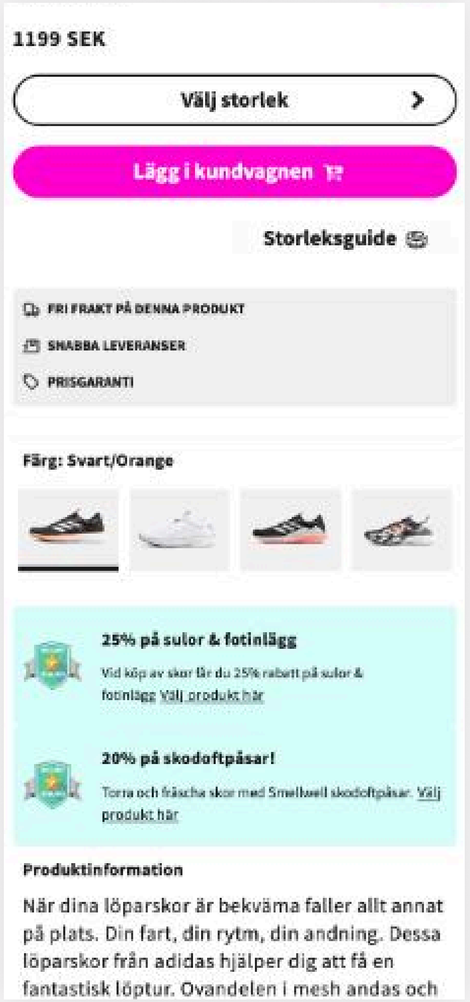

Elements were very sharp, and claustrophobic. Content such as images and text were also not well proportioned.

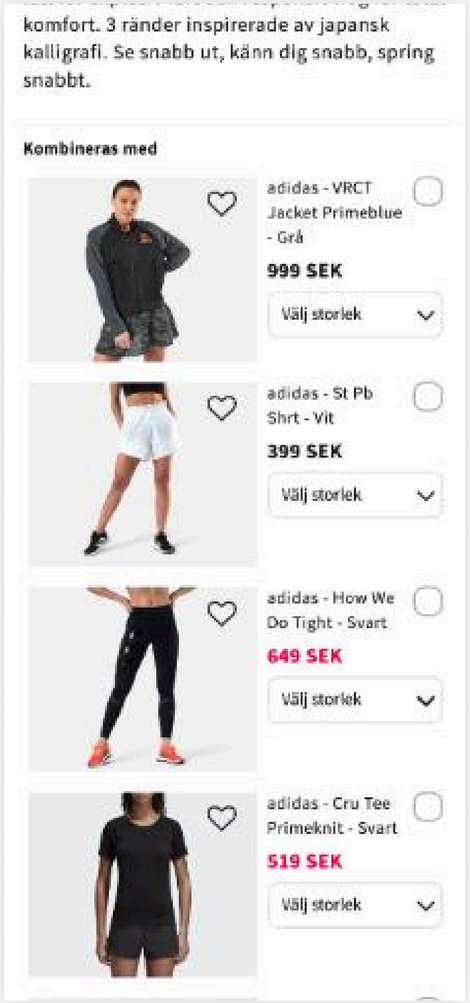

Mobile Web - How it ended up

We introduced more rounded corners to replicate the roundness and softness of gym gear and muscles, and making it feel friendly.

Retained information density to ensure we didn't change the customer experience too much - seeking information

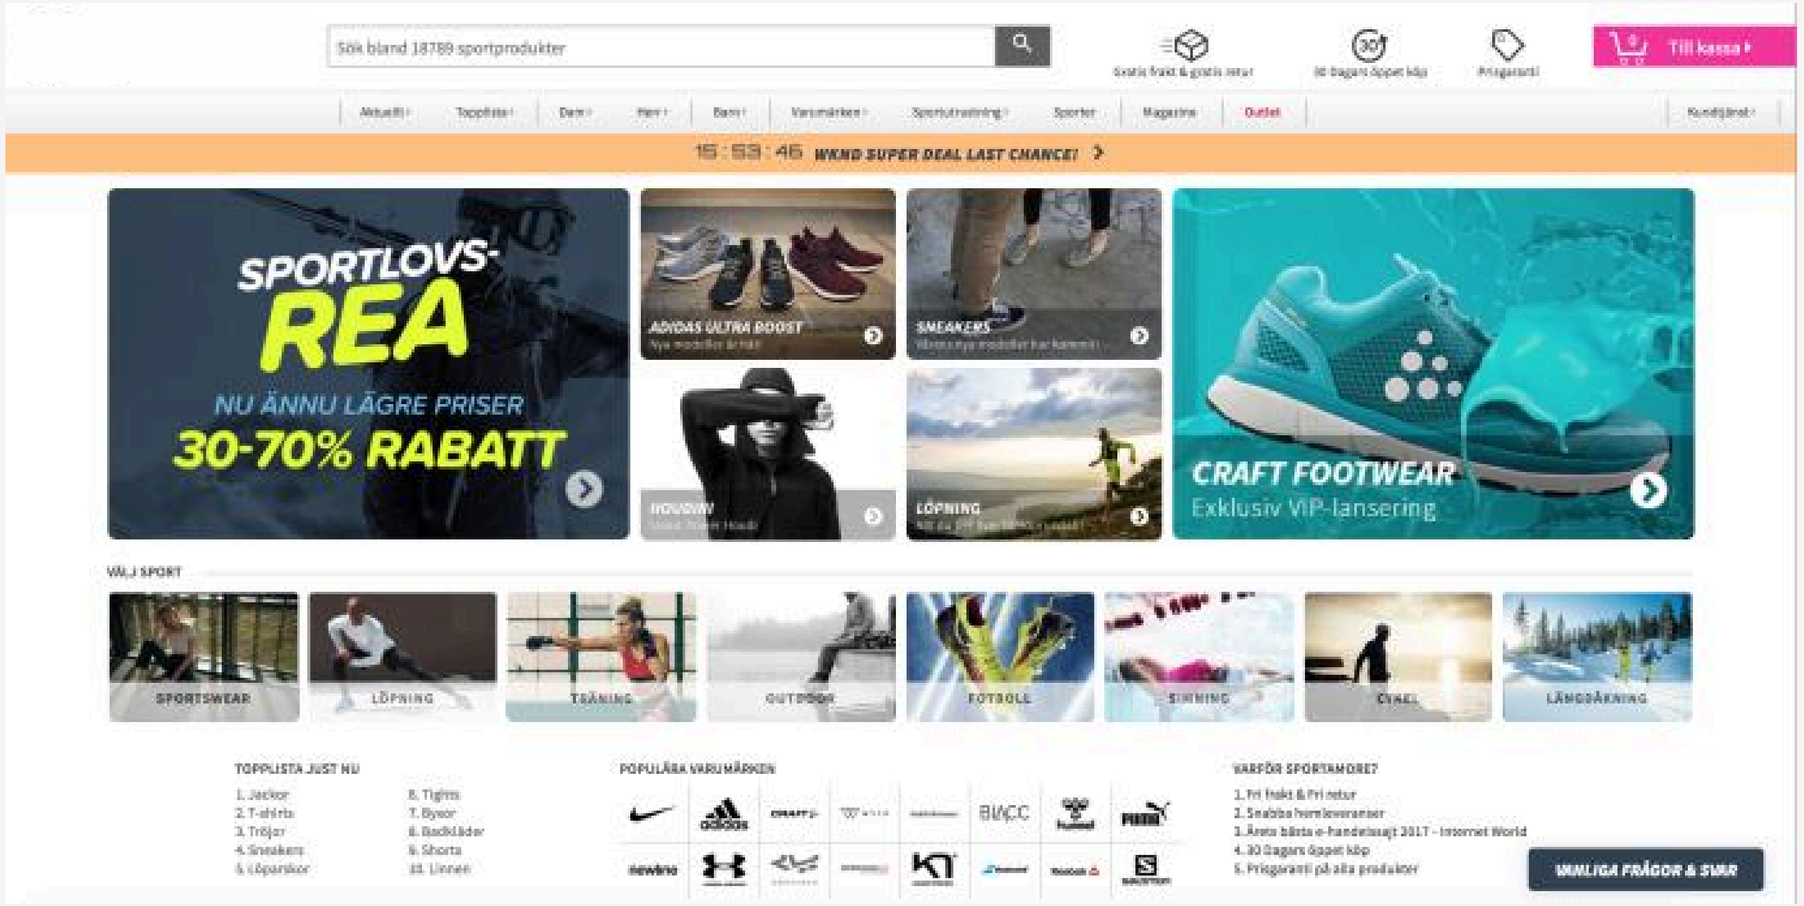

We introduced "combination" so customers could easily add to their purchase commonly bought together items.

Reviews were very important and we focused on ensuring they were still useful but also update them to feel more personal.

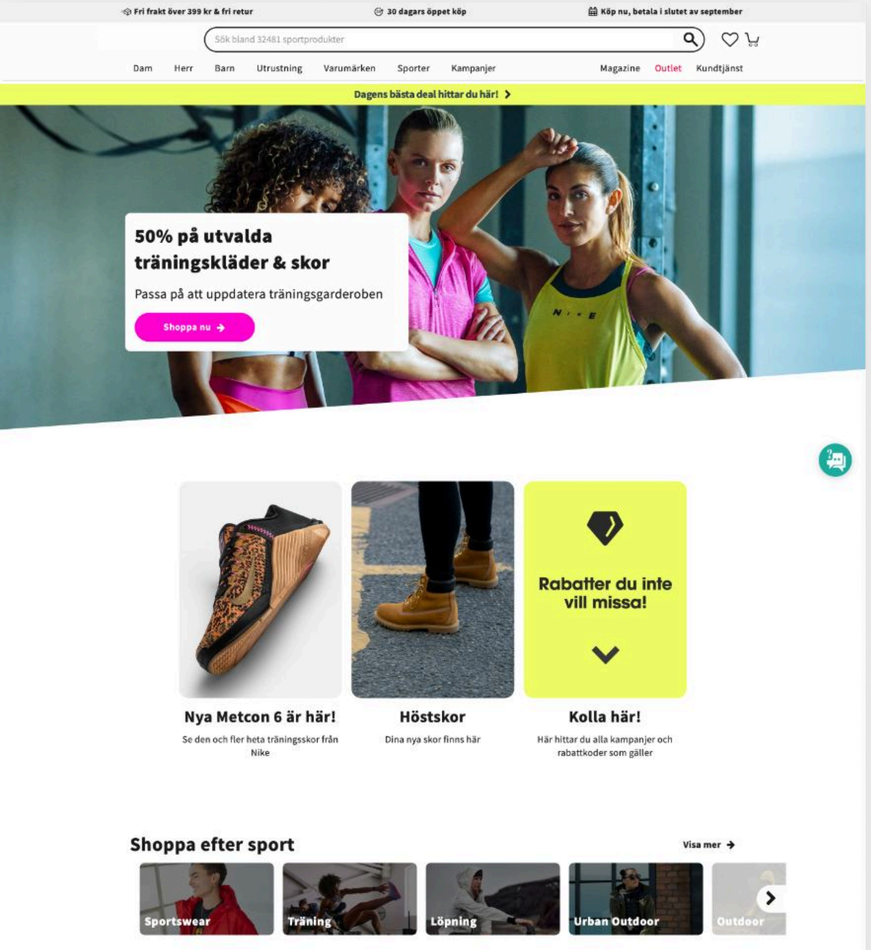

Desktop Web - How it started

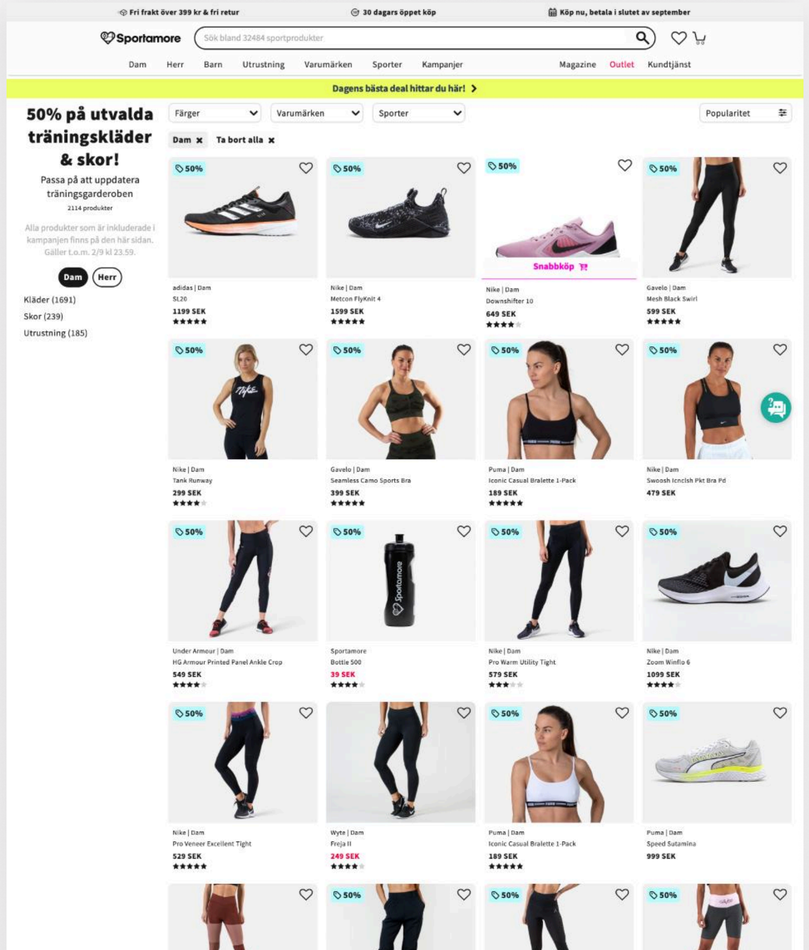

Much like on mobile, there was an inconsistency of elements, as well as an overwhelming quantity of content causing information overload.

Desktop Web - How it ended up

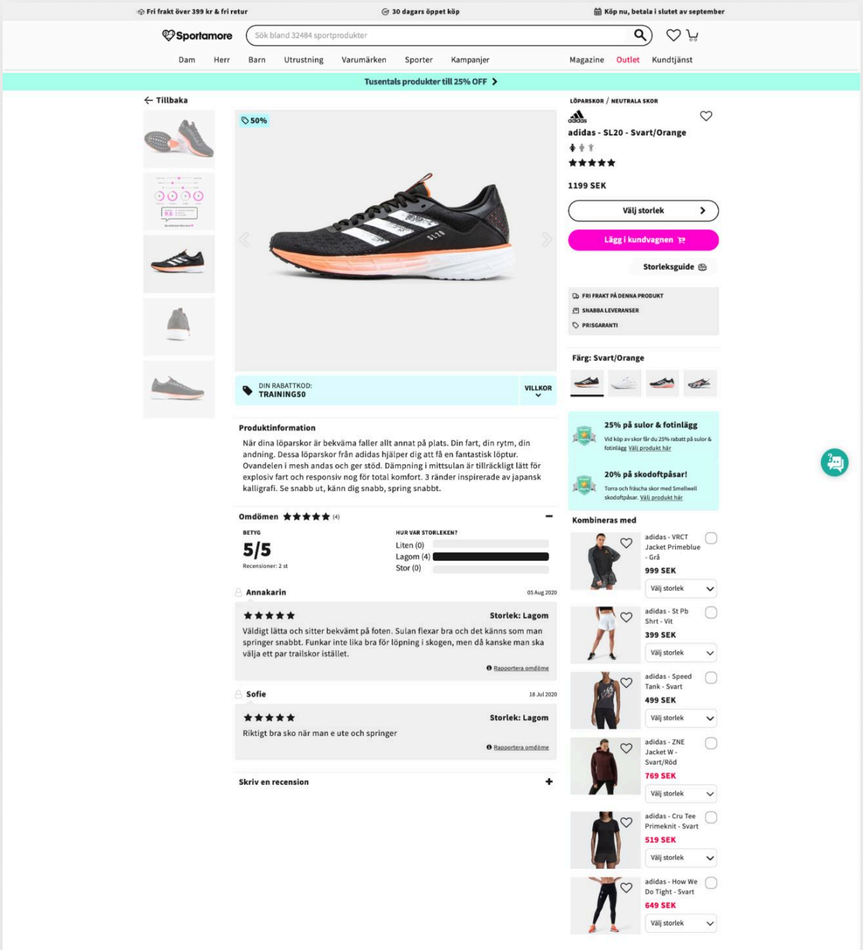

The redesign added whitespace, rounded corners and more room for content.

Since content was still largely shot in 1:1, we had to accommodate for that while we coordinate on content to be shot in 2:3.

We kept reduced the intensity of colours as well as content, allowing for the CTA to stand out, using the Brand colour sparingly.

Outcome

Analysis

Lessons

Analysis

The results were rolled out in phases, per page, on web mobile and desktop.

The outcomes were successful, increasing stickiness, such as Customer Return Rate by 15%, while improving SEO and Usability.

We also won more awards that year for Sports Site of the year, and our customers loved the changes, commenting on social media about the changes positively.

Lessons

- Validate early and often with users.

- Design Systems are enablers, not gatekeepers. Use them to accelerate exploration and feature development to provide value for customers.

- Include Brand in Product from day 1. Embed brand into the fabric of product.

- Start with a solid foundation and iterate early and often.
