Delivery

Outcome

Summary

Goal
Increase Customer Engagement of Members.

Outcomes

- 10% increase in Session Length
- Positive correlation between increased sign-ins from the Closet page.
- From concept to delivery in 5 months, record time for the company.
- Learnings like challenges to out backend infrastructure and user behaviour and needs.

Definition

Customer Needs

Business Goals

Problem Statement

Customer Needs

We had a key customer desire which we wanted to focus on:

“I want to look and feel good”

We also had a hypothesis that customers probably had an untapped potential in their existing collection of clothes bought with us.

Business Goals

Working in the Customer Engagement area, our focus was to increase Engagement (*Session Length*, *Pages per Session*, *Customer Return Rate)*.

In this particular case, we wanted to do so by making use of data we already had access to (customer purchase history).

Additionally, as a team, we wanted to get this to market in a record in 5 months.

Key Performance Indicators:

- Increase Stickiness
i.e Return Rate, *Session Length*, *Pages per Session*

- Increase Relevance
i.e Add-to-Cart Rate, *Conversion Rate*

- Provide a way to build on existing apparel
i.e Sustainability Goals

Problem Statement

As a business, we want our customers to return back to us and to find products that match their style more easily, in a sustainable way.

As a customer, I want to look and feel good. If my clothes to last longer, I can do so in a more affordable and sustainable manner.

How might we bring back our customers using clothes they already own?

Exploration

Researching “Closets”

Competitive Analysis

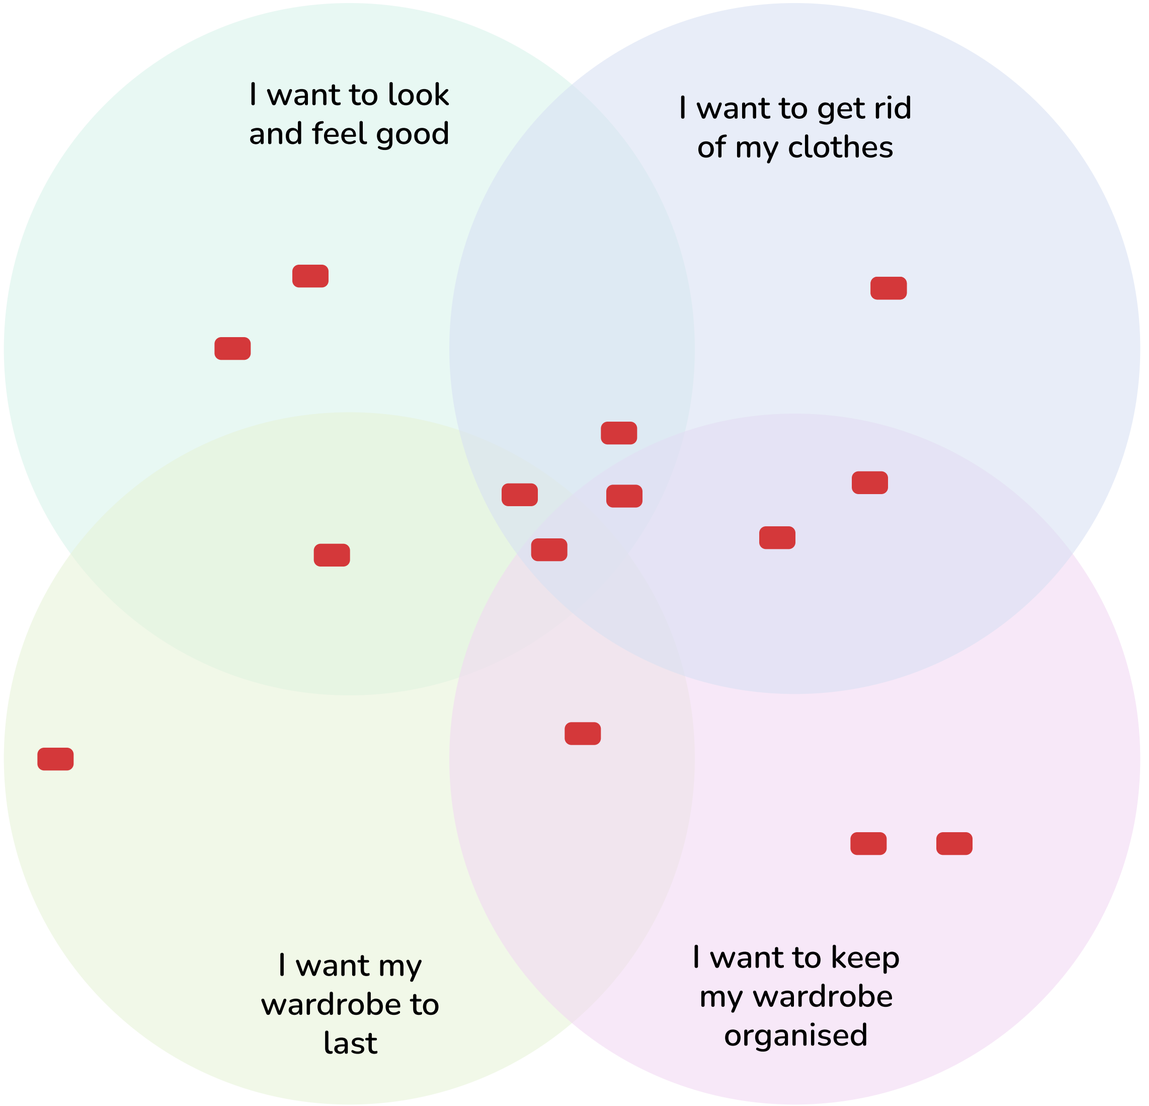

Ideation

Research

We conducted formative interviews with 6 customers to learn about their closets.

We then took these “Research Nuggets” and categorised them into 4 Jobs-to-be-done.

We also conducted a thorough Competitive Analysis covering 12 Apps and services that covered these needs.

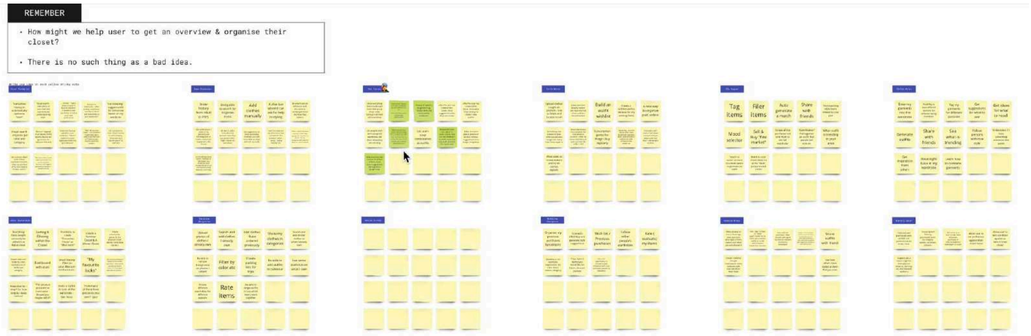

Ideation

We conducted two Design Studios with Stakeholders and collaborators:

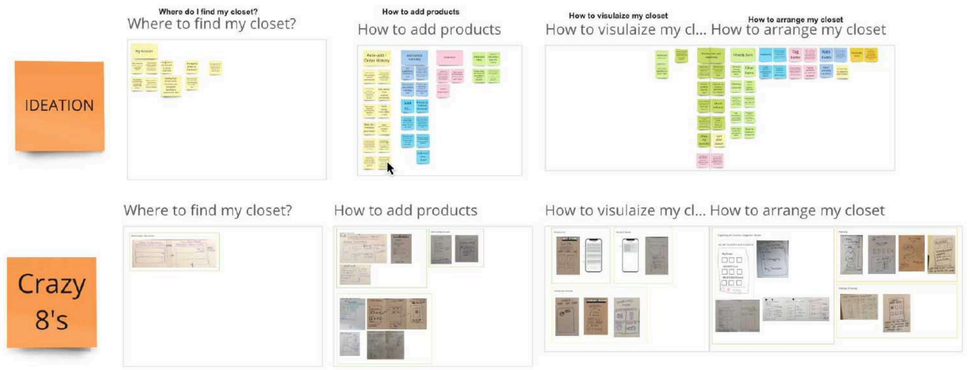

- An initial blue-sky ideation, where we affinity mapped possible ideas

- A second where we refined idea sketches and voted on the best possibles ones.

From here, we proceeded to Discovery.

First Design Studio ideas with 11 participants which provided us with plenty of backlog items.

The Second Design Studio where we clustered original ideas and grouped them based on different potential actions derived from the first one.

Discovery

Refinement

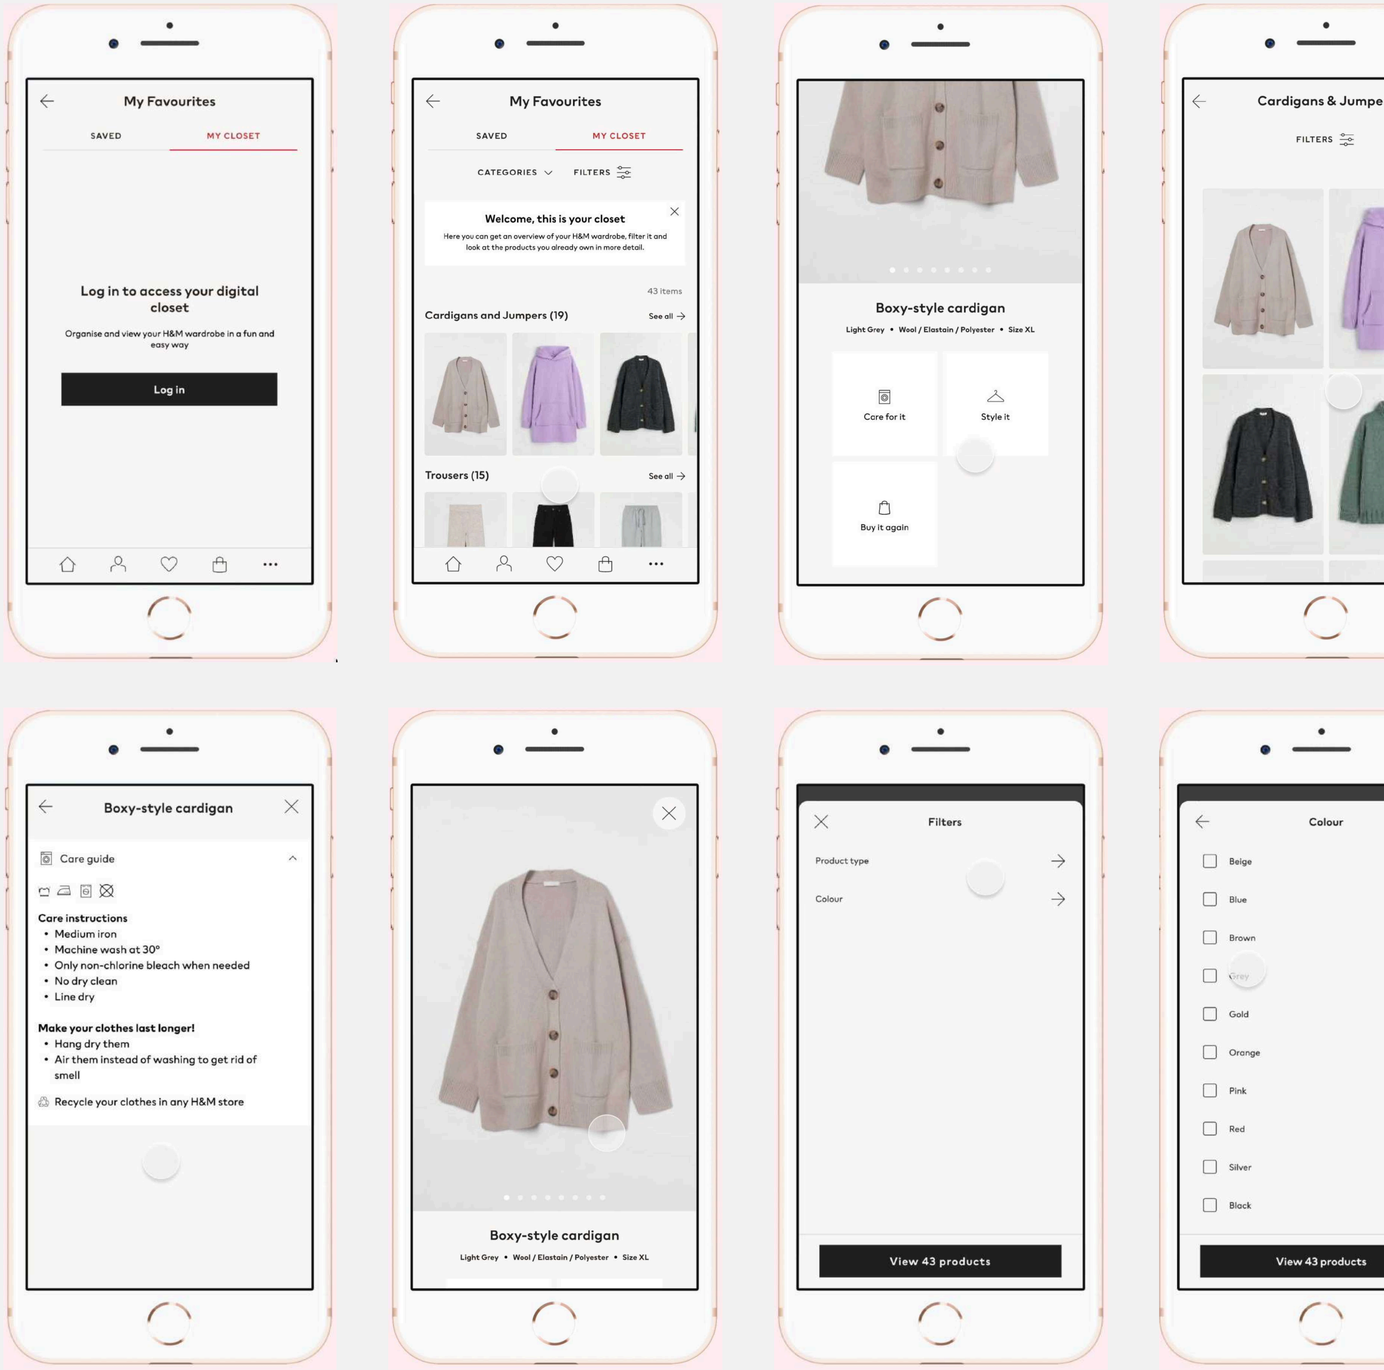

Prototyping

Usability Studies

Refinement

With ideas collected and prioritised, we jump into refinement of the ideas into artefacts that can be used in Usability and Desirability Studies.

We defined the general user-flow, the basic functionality and built a quick prototype.

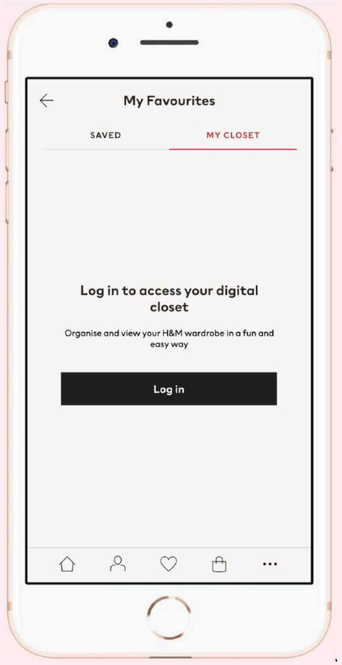

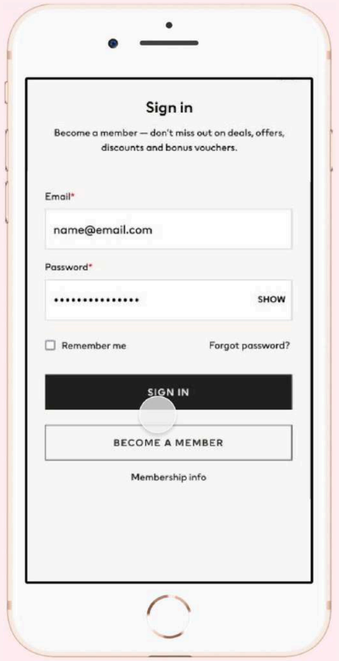

General Flow - Login

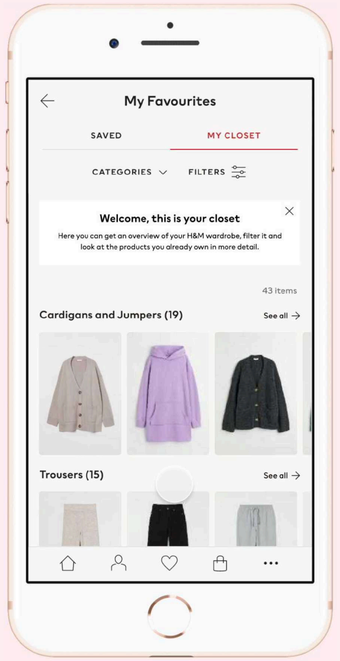

The first focus was to ensure that the Digital Closet was easily accessible.

For this we kept it as simple as possible, reusing the Sign-up/-in flow and ensuring the customer knew what they were getting before, and after, logging in.

If they had not bought any items, we'd ensure they could get shopping right away.

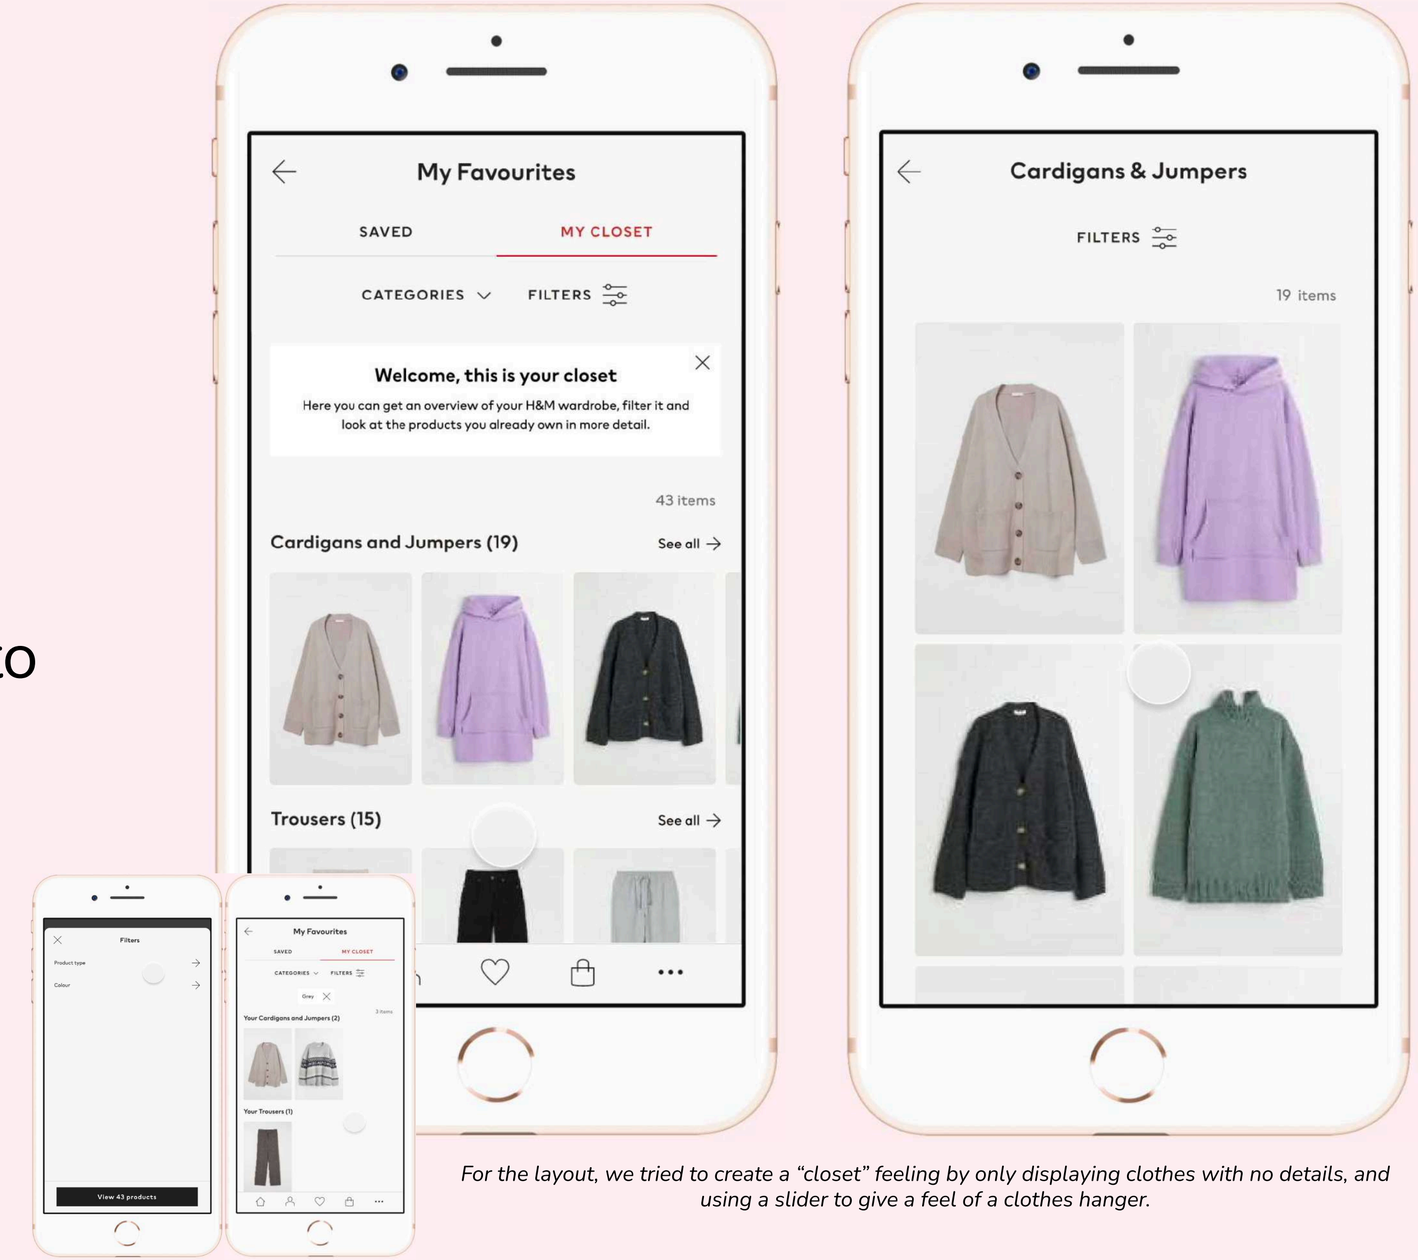

General Flow - Closet

The Closet would gather all previously purchased items, and categorise them with swip-able sliders of products.

The customer would get a short introductory message, and be able to dig deeper into vertically scrollable categories.

Both of these views can be filtered and sorted. ⟶

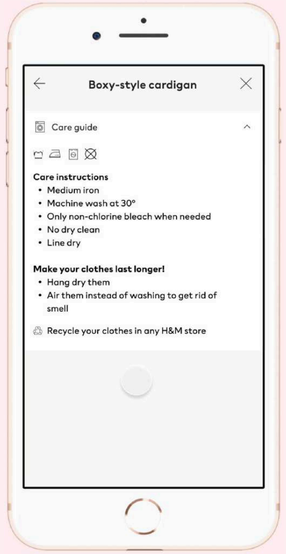

For the layout, we tried to create a "closet" feeling by only displaying clothes with no details, and using a slider to give a feel of a clothes hanger.

General Flow - Details

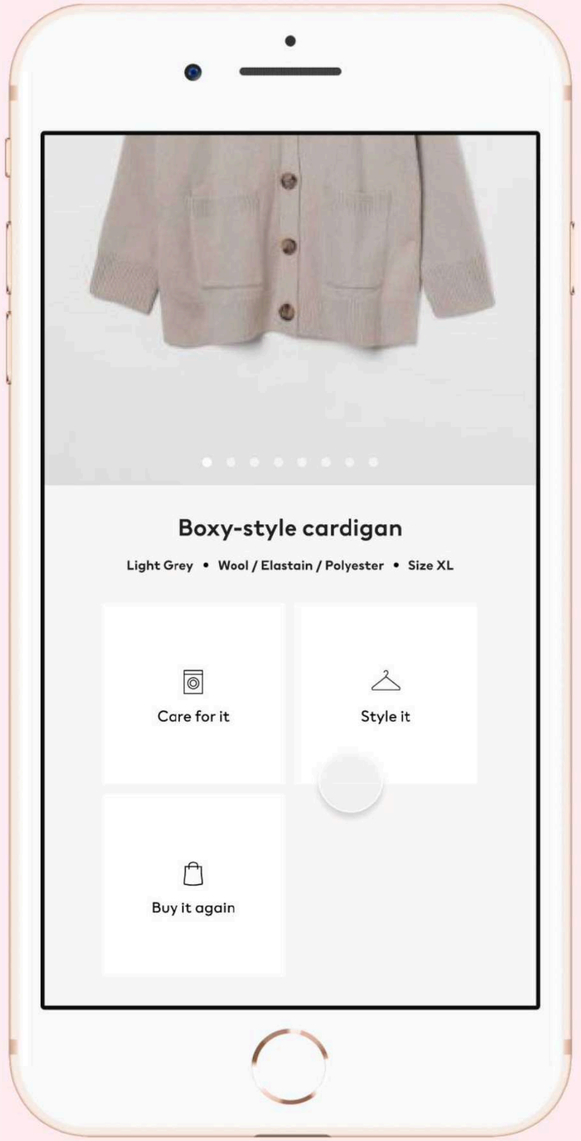

When tapping a product, the customer will get a sheet that pops upward.

It contains a scrollable image gallery, basic product information, and some options:

- Care Information ⟶
- Styling recommendations
- Ability to buy it again

Usability Studies

We built a fully functioning Prototype, and then conducted 5 Usability Studies, ranging from a Desirability study to a Time-on-Task study to identify any usability issues.

From these, we refined the final design, as well as added new insights to our backlog, like how customers wanted to tag and favourite certain items, or add new items not bought with us.

“I run out of space - I get rid of clothes”

“when I have time i organise it and make it easier to find”

“It’s sounds so cool...it’ll be a mini closet which will show clothes I like or I’d like to try”

“Oh it’s thing that I’ve purchased - It’s showing me what’s in my wardrobe”

"It's useful, I can narrow down to just see my trousers for example"

“I can look how the look together comparing”

“I don’t think I’d ever use this feature”

Delivery

Connect to Design System

Documentation

Developer Collaboration

Delivery

For the delivery we ensured all the components were based on the established Design System.

We then ensured the developers had clarity as they implemented this feature into production, however this was easy since they had been with us along the ride the whole time.

Lastly, we conducted a live study using the real live feature, and documented new improvements for the next iteration.

Outcome

Analysis

Achievements

Lessons

Outcomes

Our feature was ultimately successful in ensuring stickiness to the Favourites section with **10% increased Session duration**.
It also correlated positively with increases in sign-ins from the Closet page.

However, we also learned that the feature was very heavy and expensive to run from a back-end perspective, and wasn't that useful since only a portion of the customers wardrobes was available.

Although we flagged this early on to our stakeholders, it was still a good MVP to learn more with, and we took learnings forward, sunsetting the feature after a year.
